

The way our human eyes perceive colors is different from the lens of a digital camera. What we see as red color on a physical object may not appear as the same exact red on a photo. Even the way beings in other realms such as animals, perceive colors, is different from us. Colors are actually a spectrum of light and our eyes can detect only a certain range of light wavelengths. So there is nothing substantial or finite about them per se. Buddha has discovered this more than 2,500 years ago. There is nothing definite or substantial in this illusory world. Thus knowing this, what is there for us to grasp or attach onto?
